

## Projects

Post date:

03/08/2015 - 00:00

The webinar on the software prototype developed within the FP7 co-funded project “myEcoCost – Forming the nucleus of a novel ecological accounting system” will take place on 27 August 2015 from 1 - 2 pm CEST.

The prototype supports the transfer of environmental data in parallel with financial transactions from supplier to customer, throughout the supply chain, from extraction from nature to the end consumer. With this system in place, industry will have a tool to understand the real environmental impact of their products and services without currently needed labour-intensive data gathering. It can also provide consumers with additional information for their shopping decisions, which can promote more sustainable lifestyles. For further information, please refer to the project homepage [www.myecocost.eu](http://www.myecocost.eu).

The webinar will introduce this newly developed system and show how it can become relevant for businesses in the future and the opportunities it can offer e.g. with regard to green procurement and

environmental accounting. Furthermore, it offers you the chance to give feedback on features relevant for your company that you would like to have included in the next development phase.

For registration, please send a short note.
