

Smartrec

EE-17-2016

heat recovery with thermal storage that valorises medium to high grade waste heat, adaptable to different temperatures and industries.

Concept:

Following an end-user analysis and characterisation of exhaust streams and waste products, a life cycle costing and assessment will be carried out with candidate molten salts selected for thermal storage and heat transfer fluid, validated by corrosion testing. A custom heat pipe heat exchanger will be modelled and designed around the requirements of heat transport capacity wick structure and capable of heat exchange with a molten salt pumping loop. This loop will include a dual media thermocline thermal storage system with cost/system modelling, validation and instrumentation incorporated. A pilot will be built in a secondary aluminium recycler and/or ceramic processor valorising high grade heat for continuous salt-cake recycling. Smartrec will be validated by integration with existing systems including a fully developed instrumentation framework. A knowledge-based tool, with all relevant parameters to model the system fully, will allow

users to determine their needs & benefits and integrate Smartrec in their own systems via an open access workshop.
